# Motivation

- Anecdotaly, we know edge network policies exist

The screenshot shows a Chrome browser window displaying the Comcast Xfinity support page for 'List of Blocked Ports'. The page includes a navigation bar with 'Shop', 'My Account', and 'Support' (highlighted), and a sub-navigation bar with 'Topics' and 'Forums'. The main content area features a breadcrumb trail 'Support > XFINITY Internet > List of Blocked Ports', a title 'List of Blocked Ports', and a date 'Updated on February 10, 2015 at 2:20 PM'. Below this are 'Print' and 'Share' buttons. The 'Introduction' section states: 'Find out which ports are blocked by XFINITY and Comcast services, and why.' The 'Find the Reasons for Blocking Listed Below' section contains a table with the following structure:

Port	Transport	Protocol	Inbound/ Outbound	Reason for block
				Port 0 is a reserved port, which means it should not

# Strategy 1

ISP	SESSIONS	COUNTRY	BLOCKED (%)		
			WIN	SMTP	MSSQL
Comcast	14,765	US	99	8	
RoadRunner	6,321	US			
Verizon	4,341	US	7	21	
SBC	3,363	US	52	74	
Deutsche Telekom	2,694	DE	76		
Cox Cable	2,524	US	93	77	88
Charter Comm.	1,888	US	95	22	36
Qwest	1,502	US	18	6	
BE Un Limited	1,439	UK		49	
BellSouth	1,257	US	59	69	96
Telefonica	1,206	ES		7	
Arcor	1,206	DE	32		
Shaw Cable	1,198	US	5	59	
British Telecom	1,098	UK	10

# Strategy 2

Credit: A. Dainotti et al. *Analysis of Country-wide Internet Outages Caused by Censorship*.

# Motivation

- Leveraging darknet space allows us to develop an expectation of seeing certain types of traffic
- Absence of expected traffic becomes telling

# Problem

- We need to see specific types of traffic from many places on the network
- We introduce the concept of *traffic markers*
- We pick an energetic traffic marker, the Conficker worm, as our exemplar

# Data

- Two main sources of data:
  1. Packet traces from five /8 darknets
    - 2.25% of IPv4 address space
  2. Known Conficker host list
    - From Conficker domain sinkhole

# Data

<b>Address Block</b>	<b>Packets (billions)</b>	<b>Bytes (trillions)</b>	<b>Rate (Mbps)</b>	<b>Rate (Kpps)</b>	<b>Source /24s (millions)</b>
100/8	22.1	1.7	22.5	36.7	3.1
105/8	17.1	1.1	15.0	28.2	2.1
23/8	16.9	1.8	23.4	28.0	2.6
37/8	21.7	1.5	20.3	35.9	2.4
45/8	18.2	1.3	16.6	30.1	2.3
All	96.1	7.4	97.8	159	4.1

# Data Coverage

- Corresponds to 98.8% of IP address space based on routed prefix
- 1.6M of the 4.1M /24s contain Conficker infectees, per the Conficker sinkhole data

# Results - /24s

- We first judge /24s where we expect to see Conficker

<b>Expect Conficker?</b>	<b>Observe Conficker?</b>	<b><math>\geq 5^*</math> known infectees?</b>	<b>Judgement</b>
F	F	-	None
F	T	-	Rare
T	T	-	No Filter
T	F	T	Filtering
T	F	F	None

\* Threshold developed in paper

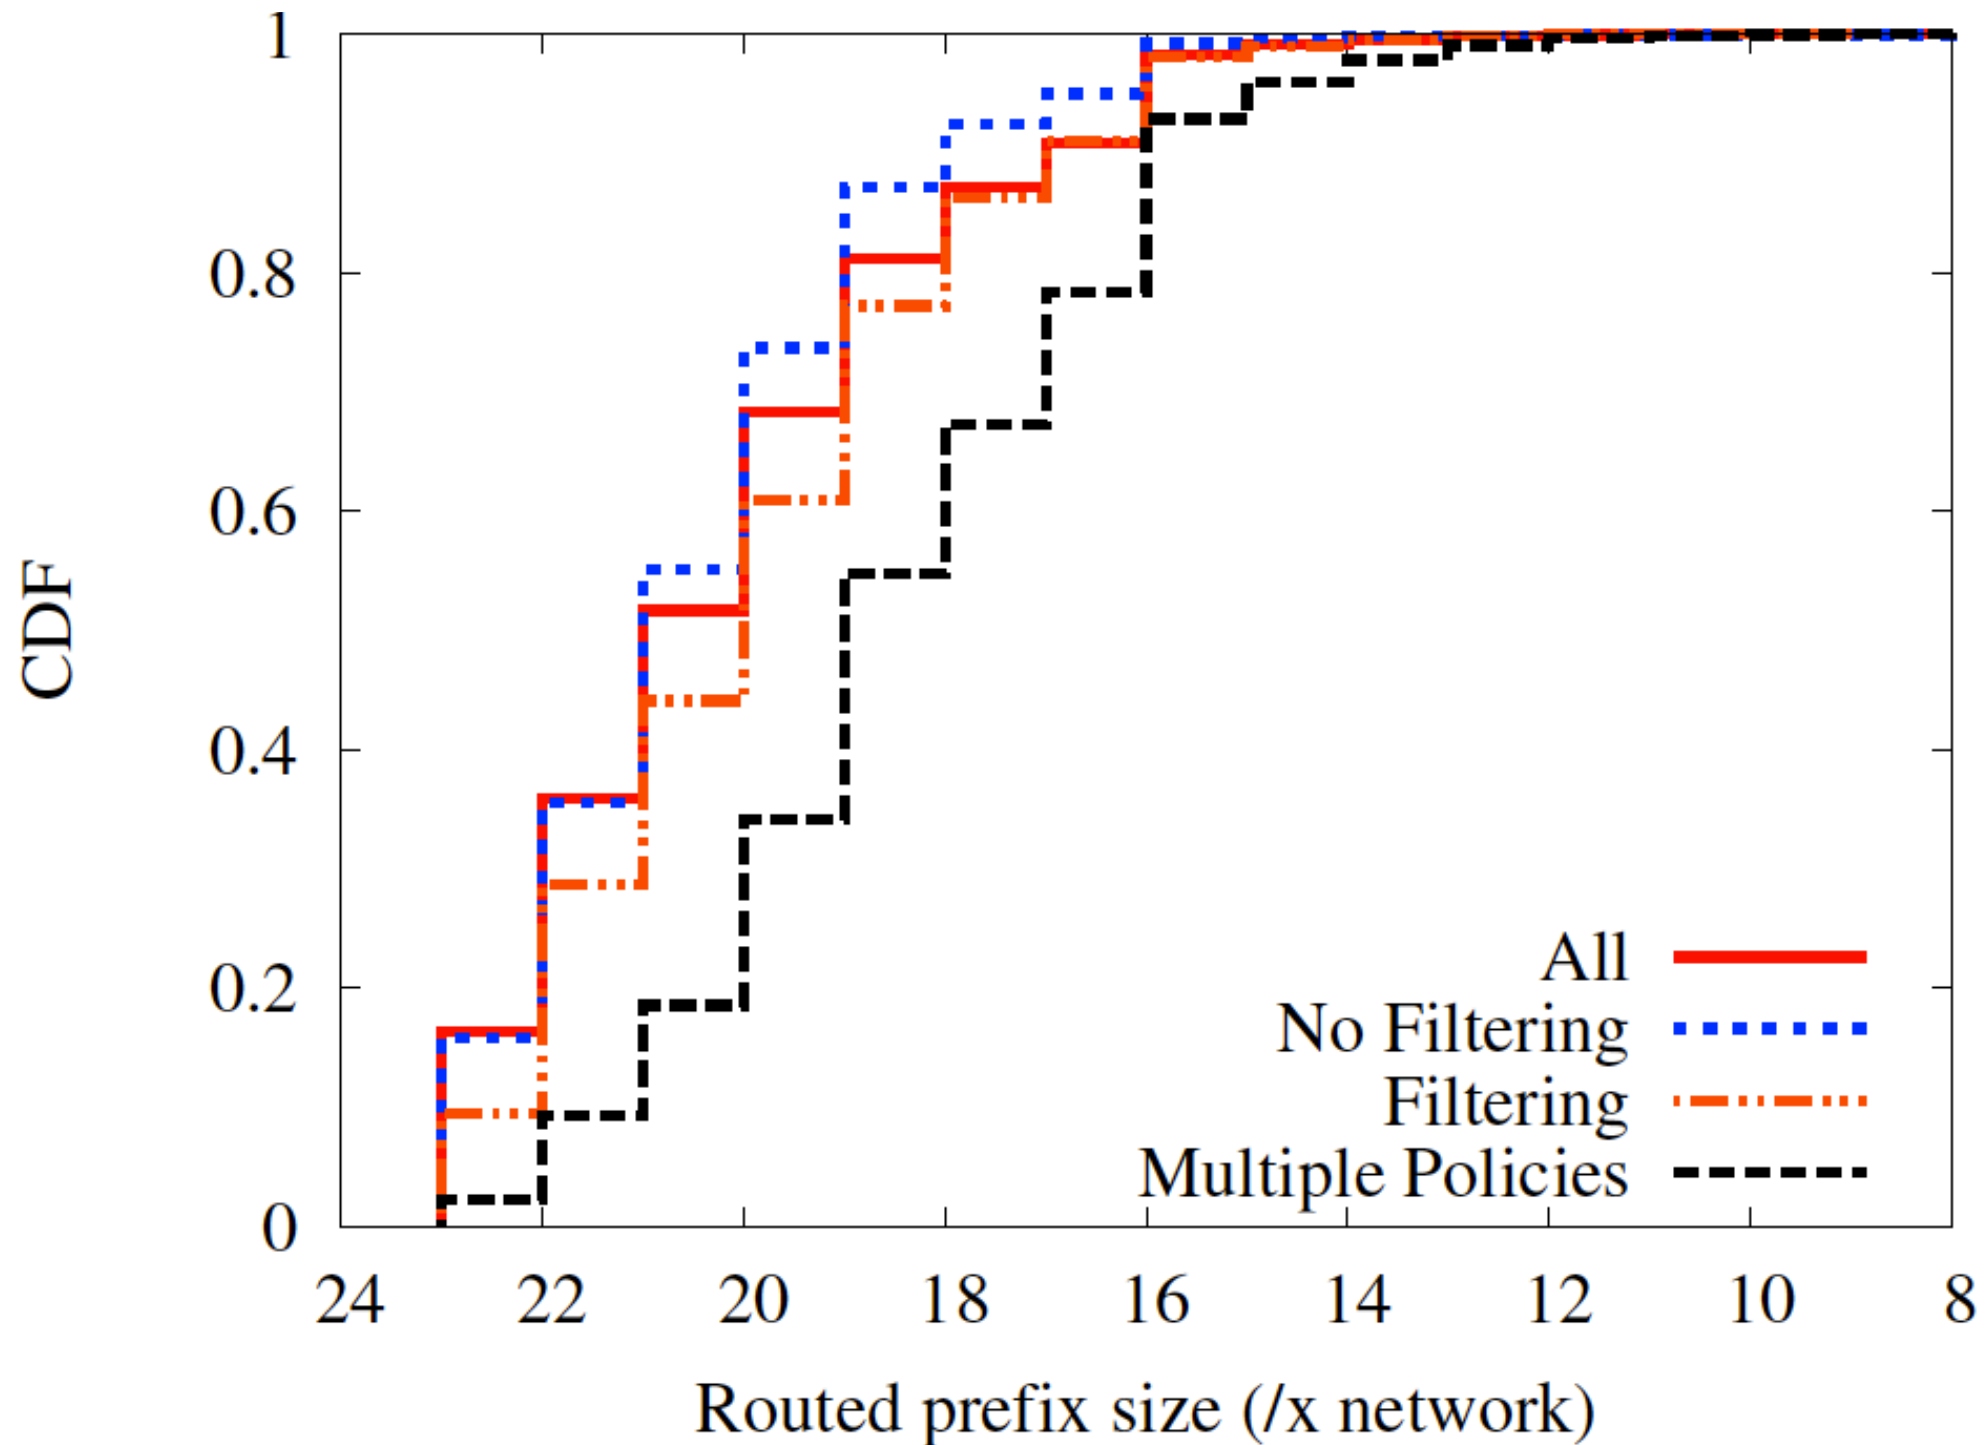

# Results - /24s

- Can make judgments on 55% of the /24s containing Conficker infectees
  - 434K do not filter
  - 448K filter
- 747K /24s do not have a enough infectees to form a solid judgment

# Results - Routed Prefix

<b>Classification</b>	<b>Amount</b>	<b>Percentage</b>
No Filtering	10,084	13%
Filtering	27,351	35%
Multiple Policies	14,536	18%
Low Signal	22,075	28%
Muddled/No Filtering	5,178	7%

# Results - Routed Prefix

# Results - Routed Prefix

- Anecdotal result from Comcast:
  - Can detect and verify TCP/445 filtering on Comcast's /15 network
- Can determine single policy for 699M IP addresses or 28% of the routable addresses.
- Original Netalyzer study had 130K test runs from 100K IP addresses

# Limitations

Darknet	# /24s Receiving SYNs	% /24s w/SYN for			
		TCP/80	TCP/139	TCP/1433	TCP/22
100/8	2.0M	14.2%	1.5%	<1%	<1%
105/8	1.5M	4.0%	1.1%	<1%	<1%
23/8	1.7M	6.2%	1.0%	<1%	<1%
37/8	1.6M	21.6%	1.0%	<1%	<1%
45/8	1.6M	5.6%	1.1%	<1%	<1%
All	3.1M	18.2%	1.3%	<1%	<1%

# Conclusions

- Original hypothesis is half-true
  - Traffic markers within darknet data can detect fine-grained network policy
  - Limited to large outbreaks with predictable traffic
- While limited in scope, policy coverage is up to 27x as much as previous work
